

Measles: A Complete Learning Guide

Sources & References

This handout lists every source cited across the six learning modules and the interactive timeline of the Measles: A Complete Learning Guide web application. Every factual claim in the app is grounded in these references — drawn from the CDC, WHO, peer-reviewed journals, and authoritative medical-history sources. All links are live and clickable so any reader can independently verify the material.

Author: Rene F. Najera, DrPH — infectious-disease epidemiologist and educator

Live app: <https://coding.epidemiological.net/measles-learn/>

Repository: <https://github.com/RFNajera/measles-learn>

Content accurate as of July 2026. Educational content — not medical advice.

About these sources

The content of this app was researched from primary and authoritative sources and then independently fact-checked against those sources. Where reputable sources disagree, the app notes the discrepancy rather than papering over it. Two such points are documented below.

Source hierarchy

- Public health agencies — U.S. CDC, WHO, ECDC, and the Public Health Agency of Canada for epidemiology, clinical, and virological facts.
- Peer-reviewed literature — Science, The Lancet, BMJ, Clinical Infectious Diseases, PLoS ONE, and others for primary research findings.
- Medical-history sources — reprints of Panum (1846), Black (1966), the Hilleman memoir, and contemporary accounts for the historical record.

Two documented points of source disagreement

1. David Edmonston's age in 1954. Contemporary accounts and Edmonston's own 2025 recollection give his age as 11 when Thomas Peebles drew the blood sample that yielded the Edmonston strain; some later sources (including the current CDC history page) say 13. The app uses 11 and cites the primary and contemporary sources.
2. The 2019 U.S. case count. Early 2020 summaries reported 1,282 cases; the CDC's current final figure is 1,274. The app uses the CDC's final number.

A note on SSPE risk figures: subacute sclerosing panencephalitis risk estimates vary by the age denominator used (under age 2 vs. under age 5) and by study population. The app therefore presents SSPE risk as a range with the caveat that risk rises the younger the child is at infection.

Sources by learning module

Module 1 — Origins & Emergence
